## **AMENDMENTS TO THE ABSTRACT:**

Kindly replace the Abstract of the Disclosure with the following new Abstract:

A method for manufacturing a supercharger rotor by casting a profile portion of a supercharger rotor and a shaft penetrating the same, having the steps of: first cutting a left and right helical cross portion on a surface of the shaft connected to the profile portion, wherein the cross portion includes a right handed helical groove and a left handed helical groove, and these grooves cross each other; and casting the profile portion around the shaft in die-casting. In this way, aA plurality of profile portion divided metal molds 12-surround a profile portion 11a of a supercharger rotor 11 to allow division and. A pair of end metal molds 14 and 15 surround both rotor ends of the rotor. A helical core 16 is attached to one end metal-mold 14 so as to be helically passed through the profile portion of the rotor. A rotor-shaped cavity 13 is formsed inside by the profile portion divided metal molds, and the end-metal-molds. Hot metal is pressurized, and injected and solidified in the cavity, and then, the end metal-mold-14 having the helical core is pulled out by being rotationed along a helical line.
